

iC-PR Series

REFLECTIVE OPTO ENCODERS

Rev A4, Page 1/18

FEATURES

- ◆ Lensless, reflective opto-encoder iCs, compact, high-resolution, incremental
- ◆ Suitable reflective code discs of $\varnothing 4$, $\varnothing 14$, $\varnothing 26$ and $\varnothing 43$ mm and linear scales with $256 \mu\text{m}$ period length
- ◆ Monolithic *HD Phased Array* with excellent signal matching
- ◆ Integrated blue LED with power control, *EncoderBlue*[®]
- ◆ Low-noise signal amplifiers with high EMI tolerance
- ◆ Pin-selectable modes of operation:
Digital A/B/Z (x1, x2, x4, x8, x16 interpolated), analog COS/SIN with analog or digital Z
- ◆ Pin-selectable index gating:
Ungated (1 T), B-gated (0.5 T), AB-gated (0.25 T)
- ◆ Pin-selectable minimal edge distance: 80 ns, 1 μs , 10 μs
- ◆ Complementary quadrature outputs PA, NA, PB and NB
- ◆ Complementary index outputs PZ and NZ
- ◆ Analog signal output for ease of alignment and resolution enhancement by external interpolation
- ◆ Operating temperature range of -40°C to $+105^\circ\text{C}$
- ◆ Compact and lensless optoQFN mold package
- ◆ Evaluation kits on request

APPLICATIONS

- ◆ Incremental encoders
- ◆ Miniature motors and actuators
- ◆ X-Y and linear stages
- ◆ Factory automation robots
- ◆ Consumer robots

iC-PR Series

REFLECTIVE OPTO ENCODERS

Rev A4, Page 2/18

DESCRIPTION

The iC-PR series are advanced optical, reflective, lensless encoder iCs featuring integrated HD Phased Array photosensors and a blue LED. They provide high signal quality with relaxed alignment tolerances. Differential digital ABZ outputs with or without interpolation or analog SIN/COS outputs with index are available. Typical applications are incremental encoders for motor control.

Blue-enhanced photosensors are adapted to the short wavelength of the embedded blue LED, and provide low-jitter outputs due to improved signal contrast. The unique assembly technology of the blue LED emitter and sensors results in low optical crosstalk.

Low-noise transimpedance amplifiers, arranged in a paired layout to ensure excellent channel matching, are used to convert the sensor signals into voltages of several hundred millivolts.

Various operation modes are selectable via tri-level inputs SEL1 and SEL2: Digital outputs with native (x1) or interpolated resolution (x2, x4, x8 or x16), analog outputs or mixed analog/digital outputs, where the latter one combines analog COS/SIN signals with a digital index. The amplified analog output signals allow for inspection and monitoring of encoder assembly. Moreover, feeding external interpolation circuits (e.g. iC-NQ, iC-TW8 or iC-TW28) is possible.

Index gating is also pin-selectable via input TZ: The options are ungated (1 T), B-gated (0.5 T) or AB-gated (0.25 T).

Via tri-level input EDC a minimal edge distance of 80 ns, 1 μ s or 10 μ s can be preset for digital operation modes.

The devices feature a low power consumption. They run at single-sided analog supplies of 4.5 V up to 5.5 V and single-sided digital supplies of 3.0 V up to 5.5 V.

General notice on materials under excessive conditions

Epoxy resins (such as solder resists, IC package and injection molding materials, as well as adhesives) may show discoloration, yellowing, and surface changes in general when exposed longterm to high temperatures, humidity, irradiation, or due to thermal treatments for soldering and other manufacturing processes.

Equally, standard molding materials used for IC packages can show visible changes induced by irradiation, among others when exposed to light of shorter wavelengths, blue light for instance. Such surface effects caused by visible or IR LED light are rated to be of cosmetic nature, without influence to the chip's function, its specifications and reliability.

Note that any other material used in the system (e.g. varnish, glue, code disc) should also be verified for irradiation effects.

7..12 n.c.¹⁾

BP Backside Paddle ³⁾

IC top marking: <P-CODE> = product code, <A-CODE> = assembly code (subject to changes);

1) Pin numbers marked with n.c. are not connected.

2) The test pins may remain unconnected. TM1, TM2, and TMO can be tied to GNDA to increase the noise immunity.

3) The backside paddle has to be connected by a single link to GNDA. A current flow across the paddle is not permissible.

PACKAGE DIMENSIONS

RECOMMENDED PCB-FOOTPRINT

All dimensions given in mm. Tolerances of form and position according to JEDEC MO-220.
 Positional tolerance of sensor pattern: $\pm 70\mu\text{m}$ / $\pm 1^\circ$ (with respect to center of backside pad).
 Maximum molding excess $+20\mu\text{m}$ / $-75\mu\text{m}$ versus surface of glass/reticle.

ABSOLUTE MAXIMUM RATINGS

These ratings do not imply operating conditions; functional operation is not guaranteed. Beyond these ratings device damage may occur.

Item No.	Symbol	Parameter	Conditions			Unit
				Min.	Max.	
G001	VCC	Voltage at VCC		-0.3	6	V

SIGNAL DEFINITIONS

Figure 4: Definition of clockwise rotation / positive direction of movement.

Figure 5: Signal definitions for clockwise rotation / positive direction of movement.

Figure 6: Definition of resolution for linear series.

VOLTAGE DOMAINS

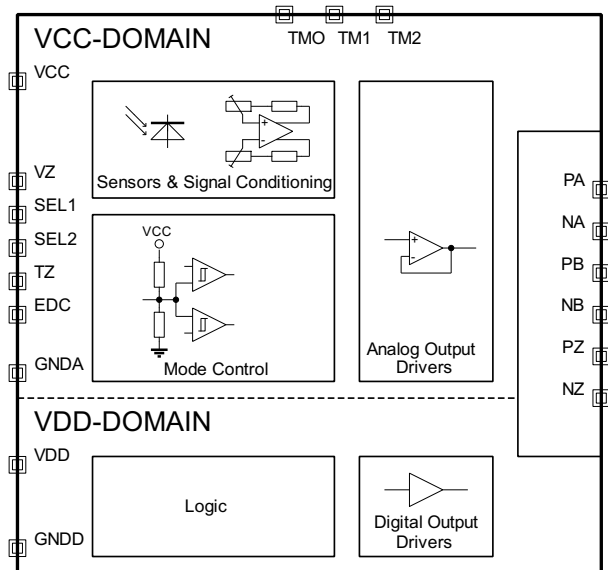

Figure 7: Analog and digital voltage domains

In iC-PR, the analog and the digital supply voltages are applied at different pins. On the one hand, this improves the quality of the analog signals, on the other hand, the digital signal output levels can be chosen to match subsequent circuitry. The internal voltage domains are shown in Fig. 7.

Please note:

- Permissible voltage ranges for VCC, VDD specified in Electrical Characteristics, parameters No. 001 and No. 003, respectively
- $VDD \leq VCC$
- reference voltage / high level for mode pins is VCC
- GND A and GND D must be at the same potential but should be connected with separate lines from a star point on the PCB

OPERATION MODES

The iC-PR series features 8 principle operation modes, which are selectable by the voltages applied to the pins SEL1 and SEL2, as summarized in Table 4.

These tri-level inputs might be connected to a voltage below $V_t()_{lo}$ (low, see 601), a voltage above $V_t()_{hi}$ (high, see 602) or a voltage between the specified values of $V_t()_{mid}$ (open, see 603). For other voltages the function is undefined.

The open configuration can be easily obtained by an external voltage divider. Alternatively, when the pin is left unconnected, the iC itself biases the input at 50% VCC (see 604).

Note: Static pin voltages at SEL1 and SEL2 are required during operation. If changing the setting of SEL1 and SEL2 pins during operation, power-on reset of iC-PR is required.

SEL1	SEL2	Mode	Description
low	high	DX1	digital A/B/Z (x1 interpolation)
high	low	DX2	digital A/B/Z (x2 interpolation)
low	open	DX4	digital A/B/Z (x4 interpolation)
high	high	DX8	digital A/B/Z (x8 interpolation)
high	open	DX16	digital A/B/Z (x16 interpolation)
open	low	A250	analog COS/SIN ($V_{REF} \pm 250$ mV), analog Z, see Figure 8
open	high	AAMP	analog COS/SIN (transimpedance amps. ± 250 mV), analog Z, see Figure 8
open	open	A500DZ	analog COS/SIN ($V_{REF} \pm 500$ mV), digital Z (ungated), see Figure 8

Table 4: Operation modes selectable by pins SEL1/2.

ANALOG / MIXED OPERATION MODES

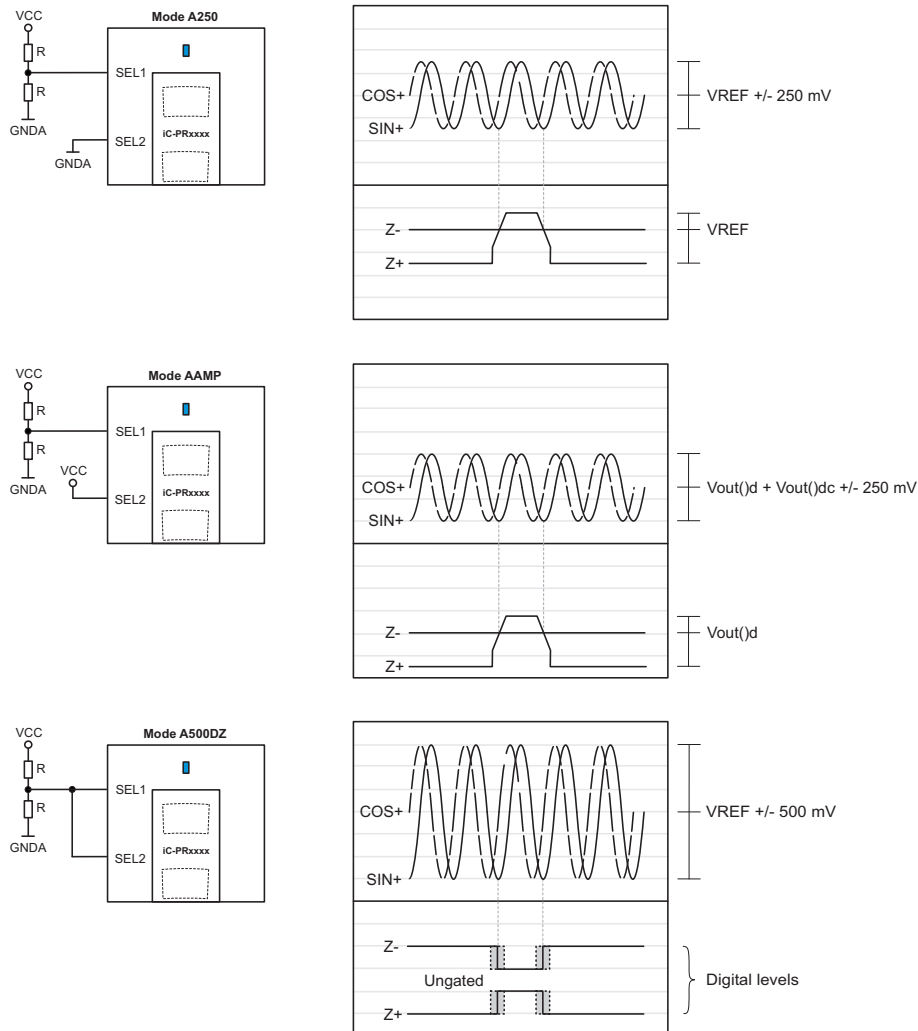

Figure 8: Analog / mixed operation modes. Complementary signals COS- and SIN- not shown.

- $V_{out()d}$ is the dark signal level of the analog signals. It is independent of illumination but proportional to temperature.
- $V_{out()dc}$ is the dc-level of the analog signals with respect to the dark signal level. It is proportional to illumination but independent of temperature.
- The permissible load current for the analog outputs is specified as parameter 211 in the Electrical Characteristics.
- For correct functionality of the Z-index, programming pin VZ has to be set to a proper value as described in section INDEX DETECTION THRESHOLD.

DIGITAL OPERATION MODES

INTERPOLATION FACTOR AND INDEX GATING

Figure 9: Digital operation modes (interpolation and index gating). Complementary signals A-, B- and Z- not shown.

An overview of the digital modes (interpolation and index gating) is depicted in Figure 9. The index gating can be controlled via tri-level pin TZ, as defined by Table 5.

Note: Static pin voltage at TZ is required during operation.

TZ	Description
low	B-gated index (180°)
high	Ungated index (360°)
open	AB-gated index (90°)

Table 5: Index gating controlled by pin TZ.

For correct functionality of the Z-index, programming pin VZ has to be set to a proper value as described in section INDEX DETECTION THRESHOLD.

DIGITAL HYSTERESIS

In all interpolation modes the iC-PR series features a digital angular hysteresis of $\frac{360^\circ}{64 \cdot \text{CPR}}$, i.e. 1 LSB of the angular resolution in mode DX16. As illustrated in Figure 10, the digital hysteresis corresponds to a slip existing between the two rotating directions. In this way multiple switching of the incremental signals at the reversing point of a changing direction of rotation is prevented.

Figure 10: Digital hysteresis in mode DX16 with AB-gated index.

EDGE DISTANCE CONTROL

The edge distance is defined as the time between two consecutive AB edges, as depicted in Figure 11.

Figure 11: Definition of the edge distance time.

With the tri-level input pin EDC a minimal edge distance of 80 ns, 1 μs or 10 μs (typical values) can be configured to suit the system on hand (cable length, external counter). It is recommended to set EDC low.

Note: Static pin voltage at EDC is required during operation.

EDC	Description
low	80 ns minimal edge distance
high	10 μs minimal edge distance
open	1 μs minimal edge distance

Table 6: Minimal edge distance controlled by pin EDC.

STARTUP BEHAVIOR

When iC-PR is powered on, the digital outputs are held in a defined state:

$$\begin{aligned} PA = NA = PB = NB &= \text{low} \\ PZ = NZ &= \text{high} \end{aligned}$$

This specific combination of output signal levels is invalid during normal operation, hence signaling that the iC is in the startup phase. Once the logic has found and verified the code disc position, valid A/B/Z signals are then output henceforth.

Note: iC-PR will also enter or remain in the startup state, when the regulated LED current exceeds a specific value, e.g. due to code disc misalignment. Once the LED current returns to a valid range, the logic will again search for the code disc position and output valid A/B/Z signals afterwards.

INDEX DETECTION THRESHOLD

Via tri-level pin VZ an internal threshold for the index detection can be controlled, as described in Table 7. Setting VZ low (maximal threshold), a safe detection of the index pulse requires stronger illumination of the respective photodiodes, which also results in a stronger interference resistance against extraneous or stray light. On the other hand, with VZ high (minimal threshold) less illumination of the index photodiodes is required for a safe detection. However, in this case the interference resistance is reduced respectively. With VZ open the threshold lies in between the other two options.

For air gap above 1.5 mm (iC to code disc), the recommended value for VZ is shown in Table 8. For smaller

air gaps, it may be necessary to decrease the index detection threshold.

Note: VZ affects all operation modes, no matter if the index signal is analog or digital.

VZ	Description
low	Maximal threshold
high	Minimal threshold
open	Medium threshold

Table 7: Index detection controlled by pin VZ.

POWER CONTROL

iC-PR devices regulate the current through the integrated blue LED, keeping the optical power constant regardless of aging effects, varying temperature or changes in air gap (iC to code disc).

In case of strong code disc misalignment or in the absence of any code disc, a maximum current is sent

through the LED, which corresponds to an overall supply current of typ. 80 mA.

When code disc and iC-PR are properly aligned, the LED current is significantly reduced and mainly depends on the code disc type and the actual air gap (see Table 8 for typ. supply current values).

SAFETY ADVICE

Depending on the mode of operation, these devices emit highly concentrated visible blue light which can be hazardous to the human eye.

Products which incorporate these devices have to follow the safety precautions given in IEC 60825-1 and IEC 62471.

HANDLING ADVICE

Because of the specific housing materials and geometries used, these LED devices are sensitive to rough handling or assembly and can thus be easily damaged

or may fail in regard to their electro-optical operation. Excessive mechanical stress or load on the LED surface or to the glass windows must be avoided.
