

# Variable Gain High-Speed Current Amplifier

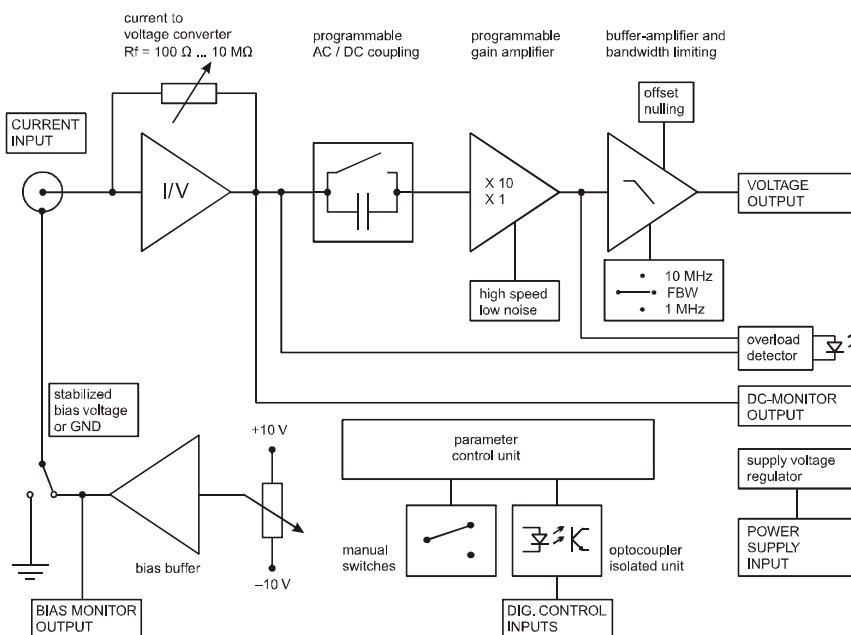

Features

- Transimpedance (gain) switchable from  $1 \times 10^2$  to  $1 \times 10^8$  V/A
- Bandwidth from DC up to 200 MHz
- Upper cut-off frequency switchable to 1 MHz, 10 MHz or full bandwidth
- Switchable AC/DC coupling
- Adjustable bias voltage for use with external photo detectors
- Input protection against  $\pm 1.5$  kV transients
- Local and remote control of all main functions

Applications

- Photodiode and photomultiplier amplifier
- Spectroscopy
- Beam monitoring for particle accelerators/synchrotrons
- Ionisation detectors
- Preamplifier for A/D converters, HF lock-ins, etc.

Block Diagram

## Variable Gain High-Speed Current Amplifier

Specifications

Test conditions  $V_s = \pm 15\text{ V}$ ,  $T_A = 25\text{ }^\circ\text{C}$ , load impedance =  $50\ \Omega$

Gain

Transimpedance  $1 \times 10^2 \dots 1 \times 10^8\ \text{V/A}$  @  $50\ \Omega$  load  
Gain accuracy  $\pm 1\ \%$

Frequency Response

Lower cut-off frequency DC / 100 Hz, switchable  
Upper cut-off frequency depending on gain setting up to 200 MHz (see table below), switchable to 10 MHz or 1 MHz

Input

Equ. input noise current see table below  
Equ. input noise voltage typ.  $2.8\ \text{nV}/\sqrt{\text{Hz}}$   
Input bias current typ.  $20\ \text{pA}$

Performance depending on Gain Setting

Gain setting (low noise) (V/A)	$10^2$	$10^3$	$10^4$	$10^5$	$10^6$	$10^7$
Upper cut-off frequency (-3 dB)	200 MHz	80 MHz	14 MHz	3.5 MHz	1.8 MHz	220 kHz
Rise/fall time (10 % - 90 %)	1.8 ns	4.4 ns	25 ns	0.1 $\mu\text{s}$	0.2 $\mu\text{s}$	1.6 $\mu\text{s}$
Input noise current density ( $/\sqrt{\text{Hz}}$ ) measured at	180 pA	11 pA	1.8 pA	480 fA	140 fA	45 fA
	1 MHz	1 MHz	1 MHz	10 kHz	10 kHz	10 kHz
Integr. input noise current (RMS)*	2.5 $\mu\text{A}$	280 nA	25 nA	3.0 nA	0.8 nA	60 pA
Max. input current ( $\pm$ )	10 mA	1 mA	0.1 mA	10 $\mu\text{A}$	1 $\mu\text{A}$	0.1 $\mu\text{A}$
DC input impedance	50 $\Omega$	50 $\Omega$	60 $\Omega$	100 $\Omega$	1 k $\Omega$	10 k $\Omega$
Gain setting (high speed) (V/A)	$10^3$	$10^4$	$10^5$	$10^6$	$10^7$	$10^8$
Upper cut-off frequency (-3 dB)	175 MHz	80 MHz	14 MHz	3.5 MHz	1.8 MHz	220 kHz
Rise/fall time (10 % - 90 %)	2.0 ns	4.4 ns	25 ns	0.1 $\mu\text{s}$	0.2 $\mu\text{s}$	1.6 $\mu\text{s}$
Input noise current density ( $/\sqrt{\text{Hz}}$ ) measured at	155 pA	5.8 pA	1.5 pA	440 fA	140 fA	45 fA
	1 MHz	1 MHz	1 MHz	10 kHz	10 kHz	10 kHz
Integr. input noise current (RMS)*	1.9 $\mu\text{A}$	240 nA	24 nA	3.0 nA	0.8 nA	60 pA
Max. input current ( $\pm$ )	1 mA	0.1 mA	10 $\mu\text{A}$	1 $\mu\text{A}$	0.1 $\mu\text{A}$	10 nA
DC input impedance	50 $\Omega$	50 $\Omega$	60 $\Omega$	100 $\Omega$	1 k $\Omega$	10 k $\Omega$

\* The integrated input noise is measured with an open but shielded amplifier input in the full bandwidth ("FBW") setting. The measurement bandwidth is 3 x the upper cut-off frequency at the specific gain setting; filter slope is a 1st order roll-off.

The peak-to-peak noise can be calculated from the RMS noise as follows:

Input referred peak-to-peak noise:  $I_{pp} = I_{RMS} \times 6$   
Peak-to-peak output noise:  $U_{pp} = I_{pp} \times \text{gain}$

Upper cut-off frequencies and equivalent input noise currents given in this table are typical values only which will depend on the source capacitance. Keep the source capacitance as low as possible by using short cables at the input to achieve best possible bandwidth and noise performance. For the dependence of the upper cut-off frequencies on the source capacitance please see the diagrams on the next page.

## Variable Gain High-Speed Current Amplifier

Specifications (continued)

Output	Output voltage range	±1 V (@ 50 Ω load), for linear amplification	
	Output impedance	50 Ω (designed for 50 Ω load)	
	Slew rate	1,000 V/μs	
	Max. output current	±40 mA	
	Output offset compensation	adjustable by offset potentiometer and external control voltage, output offset compensation range min. ±100 mV	
DC Monitor Output	Monitor output gain	Mode	Monitor gain
		low noise	gain setting divided by –1
		high speed	gain setting divided by –10
	Monitor output polarity	inverting	
	Monitor output voltage range	±1 V (@ ≥1 MΩ load)	
	Monitor output bandwidth	DC ... 1 kHz	
	Monitor output impedance	1 kΩ (designed for ≥1 MΩ load)	
Detector Bias	Bias voltage range	±10 V, max. 22 mA, connected to shield of BNC input socket, adjustable by potentiometer, switchable to GND	
	<b>Warning</b>	A bias current of 20 mA may destroy sensitive detectors. Please pay attention to the correct polarity and careful adjustment of the bias voltage to protect your detector. Put the bias switch to GND (ground) if you do not want to use the internal bias voltage. The positive and the negative supply voltage of the amplifier must be switched "on" and "off" simultaneously in order to avoid overvoltage at the bias output.	
Bias Voltage Monitor Output	Description	The signal at the bias voltage monitor output (pin 7 of the Sub-D control socket) is identical to the detector bias voltage present on the shield of the input BNC socket. By monitoring the signal on pin 7 the desired bias voltage can be adjusted through the bias potentiometer. Even if the bias switch is set to "GND", the bias voltage can be monitored and set to the desired value.	
	Monitor output polarity	non-inverting	
	Monitor output voltage range	±10 V (@ ≥1 MΩ load)	
	Monitor output impedance	1 kΩ (designed for ≥1 MΩ load)	
Indicator LED	Function	overload	
Digital Control	Control input voltage range	LOW bit: –0.8 V ... +1.2 V, HIGH bit: +2.3 V ... +12 V	
	Control input current	0 mA @ 0 V, 1.5 mA @ +5 V, 4.5 mA @ +12 V	
	Overload output	non active: <0.4 V @ 0 ... –1 mA active: typ. 5 ... 5.1 V @ 0 ... 2 mA	
Ext. Offset Control	Control voltage range	±10 V	
	Offset control input impedance	15 kΩ	
Power Supply	Supply voltage	±15 V	
	Supply current	typ. +110 / –90 mA (depends on operating conditions, recommended power supply capability min. ±200 mA)	
	Stabilized power supply output	±12 V, max. 20 mA, +5 V, max. 50 mA	

## Variable Gain High-Speed Current Amplifier

Specifications (continued)	
Case	Weight 320 g (0.74 lb.) Material AlMg4.5Mn, nickel-plated
Temperature Range	Storage temperature $-40\text{ }^{\circ}\text{C} \dots +100\text{ }^{\circ}\text{C}$ Operating temperature $0\text{ }^{\circ}\text{C} \dots +60\text{ }^{\circ}\text{C}$
Absolute Maximum Ratings	Signal input voltage $\pm 5\text{ V}$ Transient input voltage $\pm 1.5\text{ kV}$ (out of a 1 nF source) Control input voltage $-5\text{ V} / +16\text{ V}$ Power supply voltage $\pm 20\text{ V}$

## Variable Gain High-Speed Current Amplifier

Remote Control Operation	<p><b>General</b></p> <p>Remote control input pins are opto-isolated and connected by a logical OR function to the local switch settings. For remote control set the corresponding local switches to "Remote", "DC", "L" (low noise mode) and "FBW", and select the desired setting via a bit code at the corresponding digital inputs. Mixed operation, e.g. local AC/DC setting and remote controlled gain setting, is also possible. Switch setting "Bias / GND" is not remote controllable.</p>

# Variable Gain High-Speed Current Amplifier

Application Diagrams

Photo detector biasing through internal bias voltage source

Set bias switch to "Bias". The photodiode is biased through the amplifier with the bias voltage applied to the shield of the isolated BNC input socket. The photodiode should be mounted in a metal case. For optimum shielding the metal case has to be isolated from the photodiode but connected to the housing of the DHPCA-100.

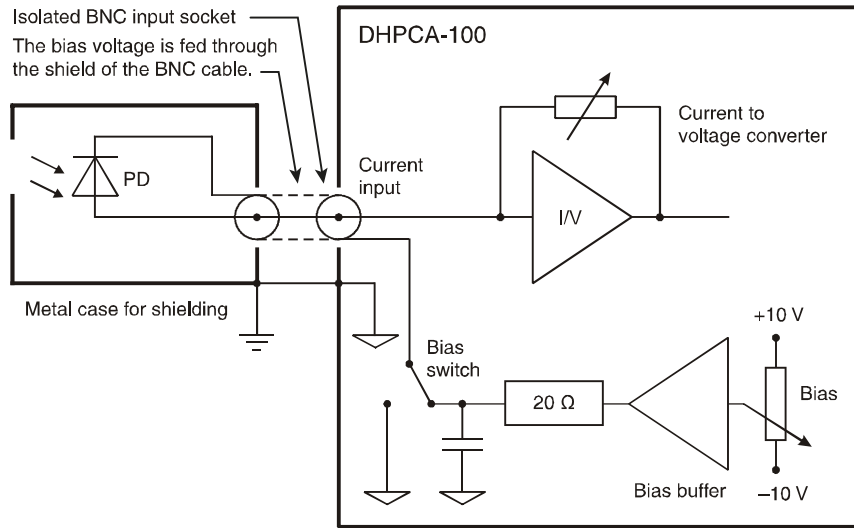

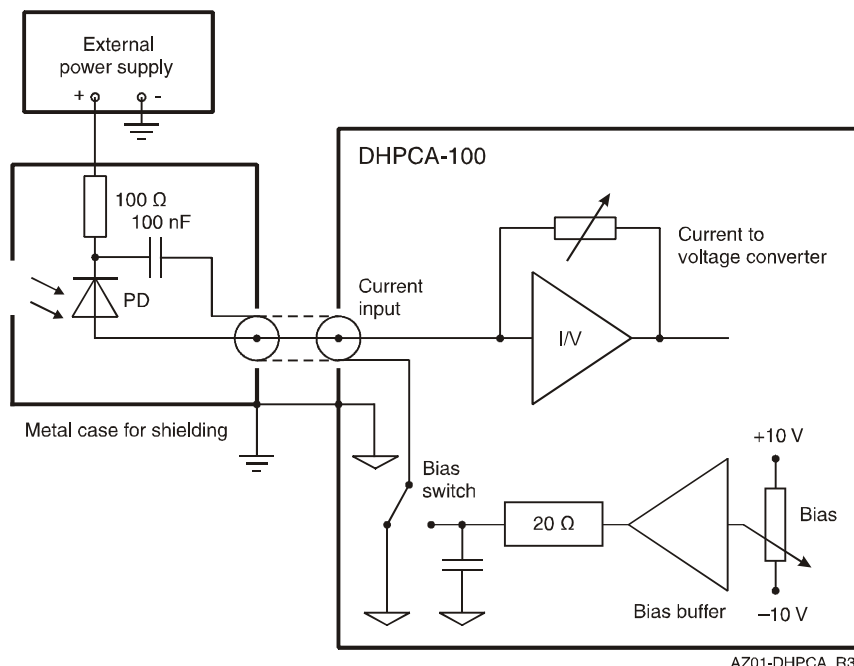

Photo detector biasing through external voltage source

Set bias switch to "GND". The photodiode is biased through an external voltage source. The shield of the isolated BNC input socket is internally set to amplifier GND. The photodiode should be mounted in a metal case. For optimum shielding the metal case has to be isolated from the photodiode but connected to the housing of the DHPCA-100.
